O*NET ANALYST OCCUPATIONAL SKILLS RATINGS: ANALYSIS CYCLE 16 RESULTS

Introduction

The Occupational Information Network (O*NET) is a comprehensive system developed by the U.S. Department of Labor that provides information for over 950 occupations within the U.S. economy. This information is maintained in a comprehensive database which was developed to replace the Dictionary of Occupational Titles (DOT) (U.S. Department of Labor, 1991). In order to keep the database current, the National Center for O*NET Development is involved in a continual data collection process aimed at identifying and maintaining current information on the characteristics of workers and jobs. The information that populates the O*NET database is collected from three primary sources: incumbents, occupational experts, and occupational analysts. Targeted job incumbents provide ratings on occupational tasks, generalized work activities (GWA), knowledge, education and training, work styles, and work context areas. Importance and level information regarding the abilities and skills associated with these occupations is being collected from occupational analysts. It should be noted that there are theoretical or philosophical reasons for preferring one rater group to the other for collecting different types of data. For example, incumbents are generally more familiar with the day-to-day duties of their job; therefore, they are the best source of information regarding tasks and GWAs. In contrast, it is likely that trained analysts understand the ability and skill constructs better than incumbents and therefore should provide the ability and skills data (Tsacoumis, 2007). Granted, it is imperative that the occupational analysts have detailed occupation information in order to rate the ability and skill constructs. It has also been suggested that some incumbents deliberately inflate their ratings to influence policy decisions regarding, for example, compensation and training (Morgeson, Delaney-Klinger, Mayfield, Ferrara, & Campion, 2004). Skill ratings may be particularly vulnerable to such effects given that they are more abstract and thus more difficult to verify than more observable descriptors such as job tasks (Morgeson & Campion, 1997; Morgeson et al., 2004). Given these considerations, occupational analysts as opposed to incumbents provide the ability and skill information in the O*NET database.

This report focuses on the skill results only. Skills reflect proficiencies or competencies that are developed through training or experience (Peterson et al., 2001). The 35 O*NET skills cover performance applicable to a broad range of jobs in the world's economy. These are grouped into seven categories: content, process, social, complex problem solving, technical, systems, and resource management.

To facilitate the skill rating process, occupational analysts are provided relevant occupational information. Trained occupational analysts are responsible for rating the importance and level of the 35 skills for each of the O*NET occupations. More specifically, eight trained occupational analysts provided ratings for each occupation. For a description of the entire analyst data collection process, including the preparation and distribution of the occupational data, the steps associated with the ratings process, and the collection and management of the skill ratings, see *O*NET Analyst Occupational Skills Ratings: Procedures Update* (Fleisher & Tsacoumis, 2012).

To ensure a controlled data collection and management process, occupational data are being collected in groups or "analysis cycles." This report describes the results from the data collection process for the sixteenth analysis cycle of 102 occupations. Reports describing each of the previous cycles are available at <http://www.onetcenter.org/research.html>. Results for subsequent cycles will be reported in separate reports. For a description of the O*NET Data

Collection Publication Schedule see <http://www.onetcenter.org/dataPublication.html>. It should be noted that the O*NET Center now uses a unique eight-digit ID Profile Identifier (IDI) code to identify each occupation. Appendix A includes a listing of the IDI codes and Occupational Titles addressed in Cycle 16.

Evaluation of Cycle 16 Analyst Ratings

As mentioned above, occupational analysts provided ratings on importance and level of the 35 skills for each of the 102 occupations in Cycle 16. The mean, standard deviation, and SE_M of the importance and level ratings were computed. These results are shown in Appendix B.

Four sets of analyses were performed to evaluate the ratings that occupational analysts provided. First, we focused on identifying the data that may be difficult to interpret based on limited agreement among raters or because there is an indication that the skill level rating is not relevant for a specific occupation. Thus, a set of recommended suppression criteria was established which flagged: (a) a skill level rating as not relevant to an occupation because of low importance ratings, (b) a skill with too little agreement in importance ratings across raters for a particular occupation, and (c) a skill with too little agreement in level ratings across raters for a particular occupation.

The remaining three sets of analyses focused on computing measures of interrater agreement and interrater reliability. Poor agreement or reliability estimates may be an indication that there is confusion about the constructs, potentially due to either the nature of the definition or rater training. Specifically, the second analysis involved computing the interrater agreement among the eight raters in each rating group. Next, the interrater reliability of the raters was computed to determine the extent to which raters agreed about the order of and relative distance between constructs on a particular scale (i.e., importance or level) within a particular occupation. That is, this analysis provides information regarding the consistency across raters in terms of how they rate the required level or relative importance of the 35 skill constructs to performance in a particular occupation. Finally, another interrater reliability estimate was computed to examine the consistency of ratings across occupations within constructs. In other words, this type of interrater reliability focused on the extent to which raters agree about the order of and relative distance between occupations on a particular scale for a particular construct.

Cycle 16 Recommended Data Flags

Three distinct criteria were established to flag the skill data. All three flags affect the presentation of data within the publicly available O*NET Online (online.onetcenter.org). First, the level rating of a skill was flagged as not relevant for a particular occupation if two or fewer of the eight occupational analysts rated its importance as two or greater. Thus, the level rating of a skill is considered not relevant when that construct is not important for performance in a particular occupation. For example, in the Cycle 16 data, the level ratings for Equipment Selection were considered not relevant for Securities and Commodities Traders (01667.01.1) and Statistical Assistants (00489.02.1) because Equipment Selection was not considered important for performance in these two occupations. In this cycle, there were 309 not relevant flags (see Table 1). To facilitate interpretation of these results, it should be noted that there are 3,570 sets of ratings (102 occupations x 35 skills) in the current cycle. Given this, 8.66% (309/3,570) of the skill ratings were flagged as not relevant. The average percentage of skill ratings flagged as not relevant across the previous 15 cycles is 14.13% ($SD = 3.79\%$); thus, the

percentage of ratings flagged due to this criterion in the current cycle is lower than the average cycle.

The skills with the most flags in Cycle 16 include Installation ($n = 70$), Repairing ($n = 40$), and Equipment Maintenance ($n = 36$). Each of these skills has received large numbers of flags in previous cycles. Given that these constructs capture fairly specific technical proficiencies intuitively not required for many occupations, these results are not surprising. In Cycle 11, there was a drastic increase in the number of flags associated with Operations Analysis. In addition, there was a reasonable increase in the flags for Science. Cycle 12 demonstrated a marked reduction in this trend for both of these skills. That trend has continued into the current cycle.

The remaining two criteria involve the recommended suppression of identifying any skill importance or level mean rating that had a standard error of the mean (SE_M) greater than .51. These criteria were established to capture those ratings deemed to have insufficient agreement across raters. The value of .51 was selected because $1.0/1.96 = .51$. An SE_M greater than .51 means that the upper and lower bounds of the confidence interval are more than one scale point away from the observed mean. There were no instances in Cycle 16 where the mean importance rating was flagged for insufficient agreement. In fact, no importance ratings received flags for an SE_M greater than .51 since Cycle 3.

The results of the suppression criteria for level for Cycles 1-16 are presented in Table 2. There were 24 insufficient agreement flags for level ratings in Cycle 16 (0.67% of the total). The skills that were flagged the most for the level criteria were: Operations Analysis ($n = 6$), Quality Control Analysis ($n = 3$), and Technology Design ($n = 3$); no other constructs were flagged more than twice. When looking at the number of occupations flagged to the total number of occupations in the cycle, the percent of occupations flagged in Cycle 16 decreased slightly from Cycle 15 (0.98%) and was lower than the percentages across all other cycles. These findings indicate a relatively high level of agreement among the occupational analysts, suggesting that the analysts have a uniform understanding of the constructs vis-à-vis the occupations examined this cycle. The detailed results of the recommended data flags and suppression criteria are depicted by the shaded cells in the results presented in Appendix B.

Cycle 16 Interrater Agreement

Interrater agreement was assessed to determine the level of absolute agreement among the occupational analysts in ratings within a construct for a particular occupation. Measures of interrater agreement index the extent to which the eight raters provided the same rating regarding the level of a skill (e.g., Reading Comprehension) required to perform within a particular occupation. To examine agreement, we calculated the standard deviation (SD) of ratings across occupational analysts for a given construct and scale for each occupation and the SE_M of these ratings. For both indices, lower values indicate greater agreement, and vice versa.

A summary of these results is shown in Appendix C. The columns labeled “Mean of M_s ” show the mean of the occupational analyst mean importance and level ratings across the 35 skills for each occupation. The columns labeled “Median of SD_s ” show the median of the SD_s associated with each mean importance and level rating across the 35 skills for each occupation. Finally, the columns labeled “Median of SE_{Ms} ” show the median of the SE_{Ms} associated with each mean importance and level rating across the 35 skills for each occupation.

The importance ratings across all occupations had a median SD of .46 and a median SE_M of .16. Interestingly, the level ratings across occupations also had a median SD of .46 and a

median SE_M of .16. Overall, the results indicate that the ratings made by the occupational analysts were quite consistent for both the importance and level scales.

Cycle 16 Interrater Reliability: Across Constructs within Occupations

To examine the interrater reliability of the Cycle 16 ratings we calculated intraclass correlations ($ICC(C, k)$; McGraw & Wong, 1996) among the occupational analysts' ratings to assess consistency across constructs within occupations. As mentioned previously, this statistic indicates the degree of similarity in the rank ordering and relative distance between the skills on a particular scale within an occupation. Our target level of interrater reliability is a median $ICC(C, k)$ of .80 or greater. The value of .80 is judged to be a good rule-of-thumb that has been used in multiple contexts, including O*NET (e.g., Clement, Chauvet, Philipp, & Ambrose, 2003; McCloy, Waugh, Medsker, Wall, Rivkin, & Lewis, 1999; Rase & Tognetti-Stuff, 1983).

The results of these analyses are presented in Appendix D. The data revealed high levels of interrater reliability across the 102 Cycle 16 occupations. Specifically, the median ICC for importance ratings for the skills across the occupations was .96 ($M = .95$, $SD = .02$). The median ICC for the level ratings was .97 ($M = .96$, $SD = .02$). The reliability for both the importance and level ratings exceeded the median target coefficient value of .80. In fact, none of the importance rating ICC values fell below .90. Similarly, none of the level rating $ICCs$ fell below .80 and only three fell below .90 (01585.01.1 Radio Frequency Identification Device Specialists, 01599.01.1 Solar Energy Systems Engineers, and 01675.01.1 Solar Thermal Installers and Technicians). Overall, the results indicate a strong level of agreement in the occupational analysts' ratings.

Cycle 16 Interrater Reliability: Across Occupations within Constructs

Another effective way to evaluate the reliability of the occupational analysts' ratings is to look at the consistency across occupations within constructs. This type of reliability is the extent to which raters agree about the order of and relative distance among occupations on a particular scale for a particular construct. For example, is there consistency across raters in how they differentiate among occupations on the required level of the skill Reading Comprehension? To make this evaluation, McGraw and Wong's (1996) $ICC(C, k)$ is calculated for each construct on each scale (instead of for each occupation on each scale as described above). For example, each of the 35 skill importance scale ratings will have a reliability value. A median $ICC(C, k)$ across the construct ratings for a particular domain on a particular scale of .80 or greater is the target interrater reliability for this coefficient (e.g., the median reliability across 35 skill level ratings should be at least .80). Again, the value of .80 has been judged to be a good rule-of-thumb.

This reliability analysis was conducted for skills on all occupations in Cycles 1 through 16 and results are presented in Table 3. The reliability analyses are based on 1,500 rating targets. The values in the columns titled $ICC(C,1)$ reflect the single rater reliabilities, whereas the values in the columns titled $ICC(C,8)$ reflect the reliability for eight raters. Overall for the skills, the median $ICC(C,8)$ across the construct ratings for importance was .87 ($M = .87$, $SD = .05$) and for level was .90 ($M = .90$, $SD = .04$). This indicates that on the whole, the reliabilities exceeded the target level. The majority of the skills had high $ICC(C,8)$ reliabilities for both importance and level. In fact, there were 10 skills with reliabilities equal to or greater than .90 for both importance and level (e.g., Science). However, there are some relatively low reliability coefficients to note.

Note. These *ICCs* indicate how consistently raters rated (rank ordered) occupations on a given skill. *SE* = Standard error of measurement = Observed score standard deviation times the square root of one minus *ICC(C,8)*.

The lowest skill *ICC(C,8)* reliabilities were found for Technology Design, Time Management, and Monitoring, all of which had importance reliabilities slightly under .80. These were the same skills with reliabilities below .80 from Cycle 15. The construct with the lowest level reliability was Coordination. The reliability for the level of this skill was .81, which still exceeds the .80 threshold. Even though these skills (Technology Design, Time Management, Monitoring, and Coordination) had the lowest reliabilities compared to other skills this cycle, the reliabilities were still considerably high; the lowest reliability coefficient was .78 (Technology Design and Time Management). A closer examination revealed relatively low between-occupation variation in the ratings for these two constructs, which is a contributing factor to lower reliability and therefore is a plausible explanation for these results.

Keep in mind that some variation in calculated values is likely to occur by chance. As previously described, the goal was for the *ICC(C,8)* reliabilities to have a median value across constructs of .80 or greater, which was achieved for both importance and level (.87 and .90, respectively). These results suggest that there was a good level of agreement among the raters with respect to the order and relative distance among occupations on particular constructs for importance and level.

Summary

The main findings of the analysis of Cycle 16 analyst ratings were as follows:

- About 91% of the skill ratings were considered important for performance of a given occupation. Constructs that were flagged because the construct was considered not important for performance were very similar to those flagged in previous cycles and conceptually it is understandable that these constructs may be considered not relevant for the given occupations.
- None of the importance ratings and less than 1% of the level ratings were flagged based on a SE_M greater than .51. For the level ratings, the percentage of skills flagged was the lowest observed across all 16 cycles.
- There was strong interrater agreement for this cycle as evidenced by the overall low medians of SE_M values.
- All within-occupation *ICC* reliabilities were above the target value of .80. These high levels of interrater reliability indicate that the occupational analysts rank ordered the skills within each occupation similarly on both importance and level.
- The importance and level median across-occupation *ICC* reliabilities were above the target value of .80. These high levels of interrater reliability indicate that analysts rank ordered occupations within each skill similarly on both importance and level.

Given these results, it appears as though the analysts are calibrated with one another and understand the skills and associated definitions. Agreement was high and there is clear evidence regarding the high quality of the data. Nevertheless, project staff will continue to review the constructs and data collection process with returning analysts prior to each new cycle and as needed, throughout a cycle. Also, staff will thoroughly train new analysts, if any.

Appendix B

Descriptive Statistics for O*NET Analysis Cycle 16 Importance and Level Ratings by Occupations

Explanation of Column Titles:

- Occupation: SOC code for the occupation – The titles associated with each code are shown in Appendix A. Note that each page contains the results for a single occupation.
- Element Name: Abilities – The name of each of the 52 O*NET abilities. Shaded abilities indicate that two or fewer of the eight analysts rated its importance as 2 or greater and, in turn, the level of that construct is flagged as not relevant.
- Mean Imp: Mean Importance Rating – The mean rating across eight raters.
- SD Imp: Standard Deviation of Importance Ratings – The *SD* of the ratings across eight raters.
- SE_M Imp: Standard Error of the Mean Importance Rating – The SE_M of the ratings across eight raters.
- Mean Level: Mean Level Rating – The mean rating across eight raters.
- SD Level: Standard Deviation of Level Ratings – The *SD* of the ratings across eight raters.
- SE_M Level: Standard Error of the Mean Level Rating – The SE_M of the ratings across eight raters. Shaded level SE_M s are flagged for insufficient agreement across raters if the SE_M is greater than .51.

Appendix C

Summary of Cycle 16 Interrater Agreement Indices

Explanation of Column Titles:

Occupation Title: Occupation title – The SOC code associated with each title is shown in Appendix A.

Importance

Mean of M_s Mean of Mean Importance Ratings – The mean of the analyst mean importance rating across the 52 abilities for each occupation.

Median of SD_s Median of the Standard Deviations of Importance Ratings – The median of the SD_s associated with each mean importance rating across the 52 abilities for each occupation.

Median of SE_{M_s} Median of the Standard Error of the Mean Importance Ratings – The median of the SE_{M_s} associated with each mean importance rating across the 52 abilities for each occupation.

Level

Mean of M_s Mean of Mean Level Ratings – The mean of the analyst mean level rating across the 52 abilities for each occupation.

Median of SD_s Median of the Standard Deviations of Level Ratings – The median of the SD_s associated with each mean level rating across the 52 abilities for each occupation.

Median of SE_{M_s} Median of the Standard Error of the Mean Level Ratings – The median of the SE_{M_s} associated with each mean level rating across the 52 abilities for each occupation.

Cycle 16 Interrater Reliability Coefficients

Explanation of Column Titles:

Occupation:	Occupation title – The SOC code associated with each title is shown in Appendix A.
Importance	Reliability coefficient representing consistency of importance ratings across abilities for each occupation.
Level	Reliability coefficient representing consistency of level ratings across abilities for each occupation.
